

⑦ Operators:

- operators are used to perform an operation using variable and values.
- Operators are special symbols in python that carry out arithmetic and logical computation.
- The value that the operators operate on is called operands.
- There are different types of operators, as follows,

(i) Arithmetic operators.

(ii) Assignment operators

(iii) Comparison operators.

(iv) Logical operators.

(v) Identity operators.

(vi) Membership operators.

(vii) Bitwise operators.

⑧ Arithmetic operators:

- Arithmetic operators are used to perform mathematical operations, like addition, subtraction, multiplication etc.
- Arithmetic is performed according to an order of operations.

| operator | Name | Example. |
|----------|-----------------|-------------------------------|
| + | Addition. | $x + y$ Ex. $10 + 10 = 20$ |
| - | subtraction | $x - y$ Ex. $10 - 10 = 0$ |
| * | Multiplication | $x * y$ Ex. $10 * 10 = 100$ |
| / | Division | x / y Ex. $10 / 10 = 1$ |
| % | Modulus | $x \% y$ Ex. $10 \% 10 = 0$ |
| ** | Exponentiation | $x ** y$ Ex. $10 ** 3 = 1000$ |
| // | Floor division. | $x // y$ Ex. $15 // 2 = 7$. |

Same as
 $10 \times 10 \times 10$

The floor division
round the result down
to the nearest whole
Numbers.

(ii) Assignment operators:

- Assignment operators are used to assign values to variables.

| operators | Example | same As. |
|-----------|----------------|------------------|
| = | $x = 5$ | $x = 5$ |
| += | $x += 3$ | $x = x + 3$ |
| -= | $x -= 3$ | $x = x - 3$ |
| *= | $x *= 3$ | $x = x * 3$ |
| /= | $x /= 3$ | $x = x / 3$ |
| %= | $x \% = 3$ | $x = x \% 3$ |
| //= | $x //= 3$ | $x = x // 3$ |
| **= | $x ** = 3$ | $x = x ** 3$ |
| &= | $x \& = 3$ | $x = x \& 3$ |
| = | $x = 3$ | $x = x 3$ |
| ^= | $x \wedge = 3$ | $x = x \wedge 3$ |
| >>= | $x >> = 3$ | $x = x >> 3$ |
| <<= | $x << = 3$ | $x = x << 3$ |

(iii) Comparison operators

- comparison (or relational) operators is a mathematical symbol which is used to compare two values.
- comparison operators are used in condition that compares one expression with another
- Result of comparison operators are TRUE, or FALSE, or UNKNOWN.

| Operator | Name | Example |
|----------|--------------------------|-----------------------|
| == | Equal | $x = 5$ $x == 5$ |
| != | Not Equal | $x \neq 5$ $x != 5$ |
| > | Greater than | $x > 5$ $x > 5$ |
| < | Less than | $x < 5$ $x < 5$ |
| >= | Greater than or Equal to | $x \geq y$ $5 \geq 5$ |
| <= | less than or Equal to. | $x \leq y$ $5 \leq 5$ |

(iv) Logical operators :

- Logical operators is a symbol or words used to connect two or more Expression such as that the value of the compound expression produced depends only on that of the original expression and on meaning of the operators.
- common logical operators include AND, OR, NOT.
- to combine conditional statements.

| operators | Description | Example. |
|-----------|---|---|
| AND | Return TRUE if both statement are true. | $x < 5$ and $x < 10$. |
| OR | Return true if one of the statement are True. | $x < 5$ <u>OR</u> $x < 10$. |
| NOT | Reverse the result, return False if the result is true. | NOT($x < 5$ AND $x < 10$) Ex. $10 < 13$ AND $10 > 5$ |

Return false because not is used to Reverse Results.

(v) Python Identity operators :

- Identity operators are used to compare the object, not if they are equal but if they are actually same object, with same memory location.

| operator | Description | Example. |
|----------|--|------------------|
| is | Return TRUE if both variables are the same object | x is y . |
| is not | Returns TRUE if both variable are not the same object. | x is not y . |

(vi) Membership operators :

- membership operators are used to test if sequence is present in an object.

| operator | description | Example. |
|----------|---|-------------|
| in | Returns TRUE if a sequence with the specified value is present in the object. | x in y. |
| not in | Returns TRUE if sequence with the specified value is not present in the object. | x not in y. |

(vii) Bitwise operators :

- Bitwise operators are used to compare (binary) Numbers.

| operator | Name | Description. |
|----------|----------------------|--|
| & | AND | sets each bit to 1 if both bits are 1. |
| | OR | sets each bit to 1 if one of two bits is 1. |
| ^ | XOR | sets each bit to 1 if only one of two bits is 1. |
| ~ | NOT | Inverts all the bits. |
| << | zero fill left shift | shift left by pushing zeros in from the right and let leftmost bits fall off. |
| >> | signed right shift | shift right by pushing copies of the leftmost bits from the left, and let rightmost bits fall off. |
